

Ord.-No.: **1024**

Specification: Corrosion prevention tape, width 50 mm
10 m length

Performance: Corrosion prevention tape for corrosion protection of conductor connections in the soil.

Application:

- The area to be wrapped is to be thoroughly derusted and cleaned with a wire bush.
- The surface must be free from grease and has to be dry.
- To attain a good anti-corrosion efficiency the tape is to be created using three layers. It is recommended that the first wrapping is to be done with at least 50% overlappings of the material. The top layering is to be done with 10mm overlapping by spirally arranging. The wrapping starts and finishes 50mm on top of the adjoining tape material.
- Great attention has to be paid to a creasefree wrapping without the forming of hollow sections. Specially in the overlapping areas the tape is again to be pressed flat against its surface.

Material	Support material coated with petrolatum
Colour	beige/brown
Width	50 mm
Thickness	1,1 mm
Length	10.000 mm
Weight	695 g
Standard reference	in following of DIN EN 12068
Packing unit	1 unit
